

## ABSTRACT

5     An information processing system contains an  
arrangement for enabling printing on demand of position-  
coded bases. In the arrangement, a current graphical  
object is selected from a set of graphical objects  
prestored in the system, which each define graphic  
information and corresponds to a rule object which  
10    connects at least one processing measure to the graphic  
information. In the arrangement, the current graphical  
object is assigned position data from a position data  
bank. The assigned position data can then be applied,  
together with the graphic information, to a substrate for  
15    forming the position-coded base. The arrangement also  
provides allocation data in the system, which associates  
the assigned position data with the graphical object in  
such a manner that position data read from the base by  
means of a digital pen device can be processed in the  
20    system using the adequate rule object.
